Robust in-line storage

The ETF accumulator provides storage within a continuous production line for various materials. It avoids an interruption of the continuous production process. This accumulator can be supplied with a moving upper- or lower bridge, a comb construction or a shaft drive. Several systems are available to counter balance the weight of the moving bridge, keeping the material tension to a minimum.

Features & options

- Robustly constructed frame
- Guaranteed horizontal bridge movement
- Drives at inlet and outlet roller
- Pneumatic or motor controlled contra weight regulation on bridge
- Pneumatically controlled dancing roller for excellent tension control
- Accumulator speed control system
- Aluminium rollers for tension sensitive materials
- Load cells for automatic tension control

Accumulator M 5150
